

## High Availability Fail-Over Policy

Purchase (2) two gateways, a primary and secondary, paired for a single end-site – each with a High Availability Fail Over module. You will only pay for upgrades on the primary gateway, which means only a base gateway purchase is required for the second gateway. There is no requirement to upgrade to a higher user count or to add other software modules to match the primary unit.

Ensure continuous connectivity in a cost-effective manner.

**Free Optional software module – on second base gateway purchase**  
**Free Device user count upgrades – on second base gateway purchase**  
**Plus Single software license applicable to the pair (see details below)**

Upgrade purchase required on primary Gateway 1 only!

Example:

Primary	Secondary
AG 5900 Gateway 1 Purchase	AG 5900 Gateway 2 Purchase
High Availability Failover module	High Availability Failover module
1000 user bundle	500 user bundle (base user count)
PMS Hospitality Module	No additional software module required

### How it works:

To pair two gateways at a single site, please contact our support team at [support@nomadix.com](mailto:support@nomadix.com). Identify the primary and secondary back-up gateway ID numbers.

The initial license period on the primary unit will be extended by adding the (1) one year license value from the secondary base unit. This means (2) two years license is applicable for the primary unit, regardless of the user count category.

A new software license key configuration for the registered secondary gateway (to match the primary gateway device user counts and optional modules) is provided at no charge.
